We present a study on the effects of ripening on the chemical composition of organically and conventionally farmed kiwi fruits (Actinidia hypogaea). Farmed kiwi fruits were sampled from two commercial smallholder farms in New Zealand, one farmed organically and the other conventionally. Kiwi fruits were randomly sampled from a crate for one commercial seller and a retailer for both farmers' farms. Apple-kiwi fruits were also purchased from two supermarkets in Auckland. Conventional kiwi fruits were typically a brighter orange colour, had greater firmness and juice content, were higher in citric acid, glucose, fructose, pH, titratable acidity and anthocyanins, had greater total polyphenol content, and more strawberry flavour compared to organically grown kiwi fruits. Organically grown kiwi fruits had higher total polyphenol content and a higher ratio of A-type flavonols to total flavonols compared to the conventionally grown kiwi fruits. When comparing organically and conventionally grown fruits from the same farm, they were more similar in terms of colour, flavour, firmness and fruit structure. Fruit from the organic farm had slightly higher malic acid content than the conventionally farmed fruit. Kiwi fruit from organic farm had greater concentrations of anthocyanin and total polyphenol compounds than conventionally grown kiwi fruit. There was no difference in the bioactive compounds of apple-kiwi fruits. The study suggests that conventional kiwi farming practices may be of concern to consumers of kiwi fruit due to the large differences in the chemical composition of fruit from conventionally and organically farmed fruit. There was no consistent difference in chemical composition between conventionally grown fruit from the two different farms. Abstract: Distribution, accumulation and characterization of trace elements in the shoots of the leguminous plant Amaranthus caudatus, a wild leg
