Applications using the VBA API can manipulate the native AutoCAD commands and properties through custom AutoCAD commands and the AutoCAD Object Model. This is a very limited form of programming because AutoCAD is not a true object-oriented programming language. AutoCAD's native commands are very similar to procedural programming, and VBA does not have access to most of the native commands. The VBA API can be compared to a C compiler; VBA makes it easy to write your own functions, but does not provide built-in control of the object model and other elements. VBA access to drawing layers and items is limited to just those the application was designed to manage. In AutoCAD, all application-specific drawing layers and items are always part of the native file format. When a DXF or DWG file is opened by an application that does not have access to the native file format, its own drawing layers and items are not present. Most recent AutoCAD applications are using the .NET (C#) or Visual LISP API. Open Architecture Autodesk introduced the Open Architecture Framework (OAF), a new programming model for product design. OAF is a layer above AutoCAD. The purpose of OAF is to define the interface for external applications to AutoCAD by building plugins on top of a set of common programming interfaces. OAF consists of a plug-in

framework for building application plugins (applications), a programming model, and a set of toolkits that provide common services such as file handling and navigation. The OAF framework is currently available on the Autodesk Exchange site for Visual LISP, .NET and Visual Studio.
