There is an increased emphasis on the highlights and shadows in the new native APIs. In the past, Adobe's managed software was always careful to ensure that the highlights and shadows were consistent with the underlying platform. The native APIs now represent the new information that is being delivered to screen and, as such, Photoshop's tone-mapping algos need to be updated to the new tone-mapping algorithms. ColorSync is still included in Photoshop, and users will have access to the same color profiles they have always had, but adjustments can no longer be made to existing color profiles. This means that users of color managing apps such as Photoshop will need to be re-educated on how to best handle their color. The native APIs also mean that we are not being advised to have an action to move to full-on color managed work. Adobe has always used the term "native" when describing the APIs that Photoshop is now using so this term is now going to be used to describe how Photoshop handles tone-mapping. The term is being used to highlight the fact that Photoshop is being built natively and not a subset of native API functionality. The native APIs are

intended to be the best native APIs for that platform, so for platforms such as Android, iOS, OS X and Windows that does not include any form of GPU support, Photoshop will not be able to provide the best experience. The term native SOP was never really used in relation to the previous software. The native APIs that are now the norm really only relate to the native GPU on a computer. All current and previous SOP devices render in software in the APIs that have been in place since Photoshop and the older SOP devices unsupported.

Earlier this year, with the release of Photoshop CC 2020 , Adobe released some of the first 100 per cent dark mode options for both desktop and mobile versions of the software. This means that you now have even more occasions to switch your display to dark mode, without having to hunt around for toggle features. Dark mode also allows you to save more power and increases battery life. Did you know you could save a number of different versions of an image? Well, with the updated version on Photoshop, you can. Photoshop allows you to save up to eight versions of any file in your computer starting at 32-bit per channel. This includes edits to exposure, highlights, shadows, highlights, in-camera profiles, certain global adjustments like contrast, and more. To save files, you need at least one existing image file, a New Layer, and a corresponding name. The catch is that you're limited to these selections with no other layer modifications you'd like to incorporate into

your saved image. Auto Locking is a feature that allows you to lock an adjustment the moment you use it. After locking an adjustment, you can now switch back to other layers or other images, or even go on to create a new layer using the same adjustment. You can also use the lock feature to make an adjustment to an entire layer. Next, you have the option of using the lock feature to apply an adjustment to multiple layers at once for a split-second preview. When you first open an image in Photoshop, it will have a Prompt setting of what should the default "Save As" when you save an image. For example, you have three different prompts: "New File," "Save," and "Save As.
